

Dual boot exercises- 1

Installing Windows 7 and 10 in the same virtual machine.

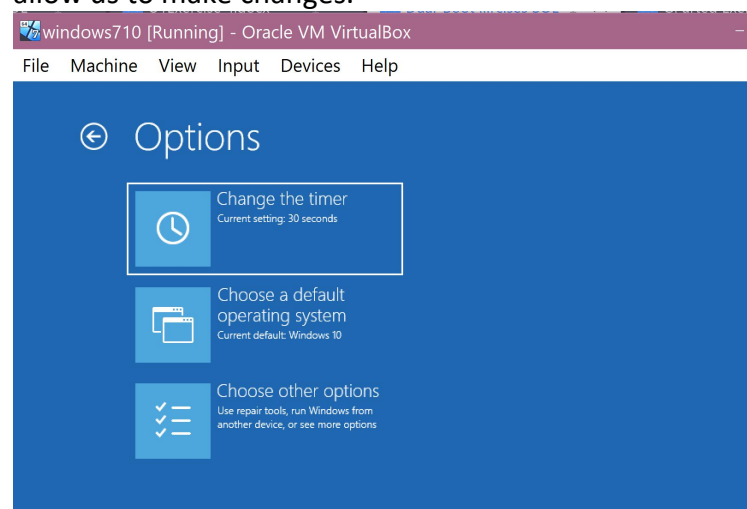

The first thing we have to do is install Windows 7. We do this following the process explained in previous exercises.

Next we install Windows 10.

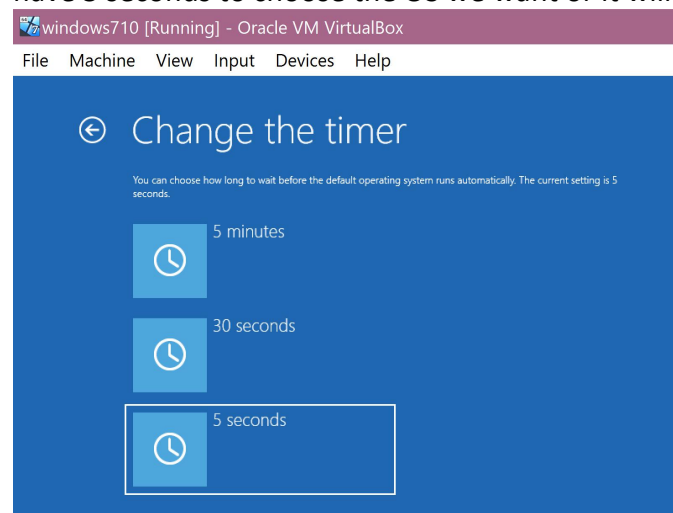

After both are installed this menu should appear

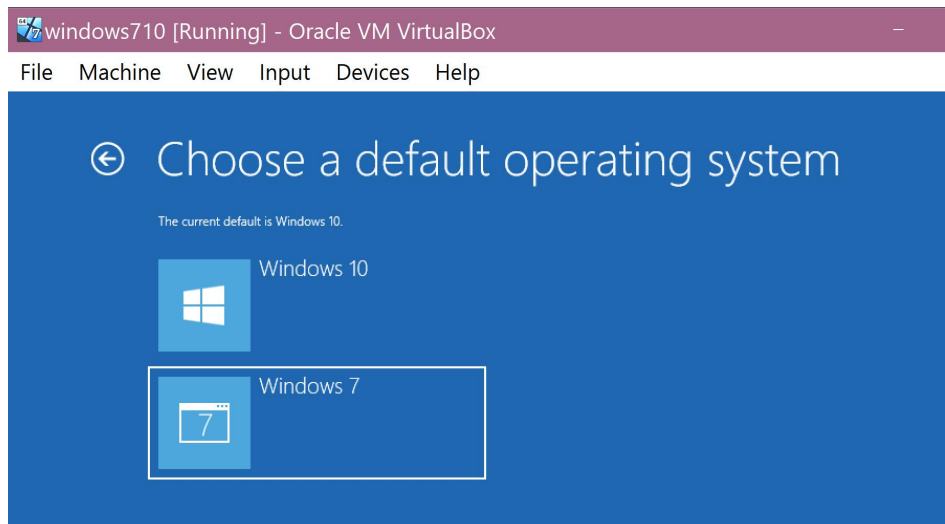

There should be an option below these two that would take us to the next menu and allow us to make changes.

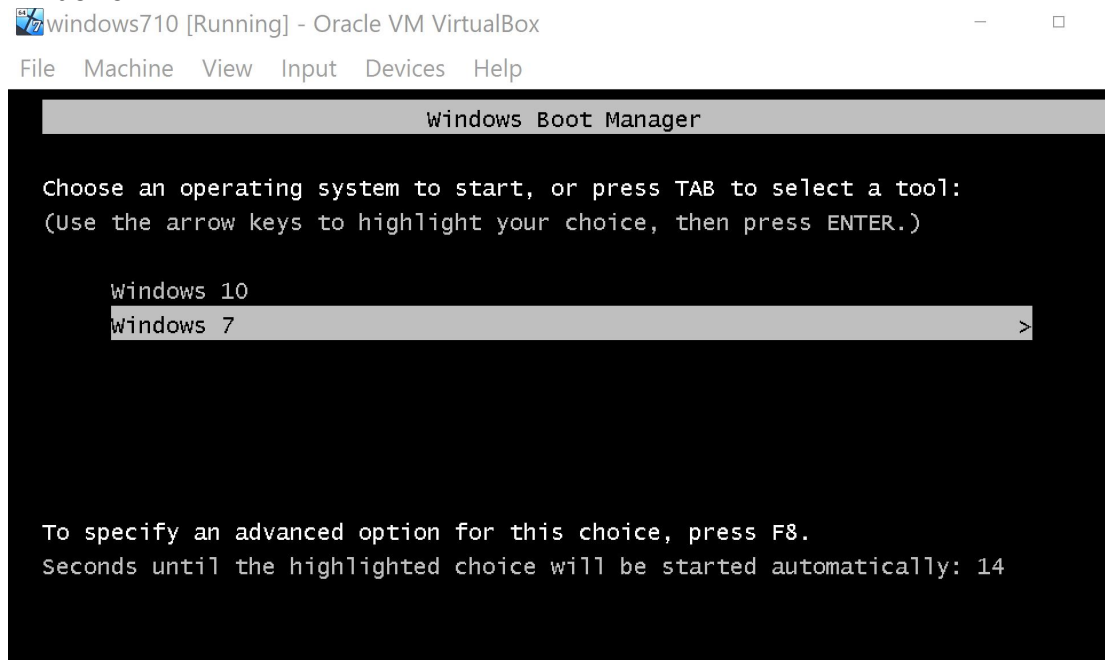

If we click the first option it will allow us to change the timer, in this exercise we need to set it to 5 seconds. This means when we run the virtual machine we will have 5 seconds to choose the OS we want or it will directly start with the default OS.

To change the default option we need to go back to the options menu and click on the second option. And choose Windows 7.

After doing this the menu where we choose the OS will become the one from windows 7

If we want to change anything, we can also change the settings inside the machine. To do so we would need to access the System Configuration menu and then click on boot. There we can change the default OS and the timer.
